

Quality improvement in paediatrics

Dr Sue Chapman

Great Ormond Street Hospital for Children
International and Private Patients team

Learning objectives

- Define quality
- Explore the principles of quality improvement
- Model for improvement and SPC charts
- Getting started
- Tips for success

What is quality?

The dimensions of quality	
Safe Avoiding harm to patients from care that is intended to help them.	Timely Reducing waits and sometimes harmful delays.
Effective Providing services based on evidence and which produce a clear benefit.	Efficient Avoiding waste.
Person-centred Establishing a partnership between practitioners and patients to ensure care respects patients' needs and preferences.	Equitable Providing care that does not vary in quality because of a person's characteristics.

the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge

Institute of medicine

The Health Foundation 2013 Quality improvement made simple: What everyone should know about health quality improvement

What is quality improvement (QI)?

A systematic, formal approach to the analysis of practice performance and efforts to improve performance

www.aafp.org

Principles of QI

- Understand the problem
- Data and measuring for improvement
- Understand the process
- Improve reliability
- Analyse demand, capacity and flow
- Choose tools to bring about change
- Enthuse, involve and engage staff
- Involve patients and co-design

QI tools

based co-
design

Model For Improvement

Aim – how much, by when?

Measurement

Frontline staff suggest innovative ideas to overcome problems

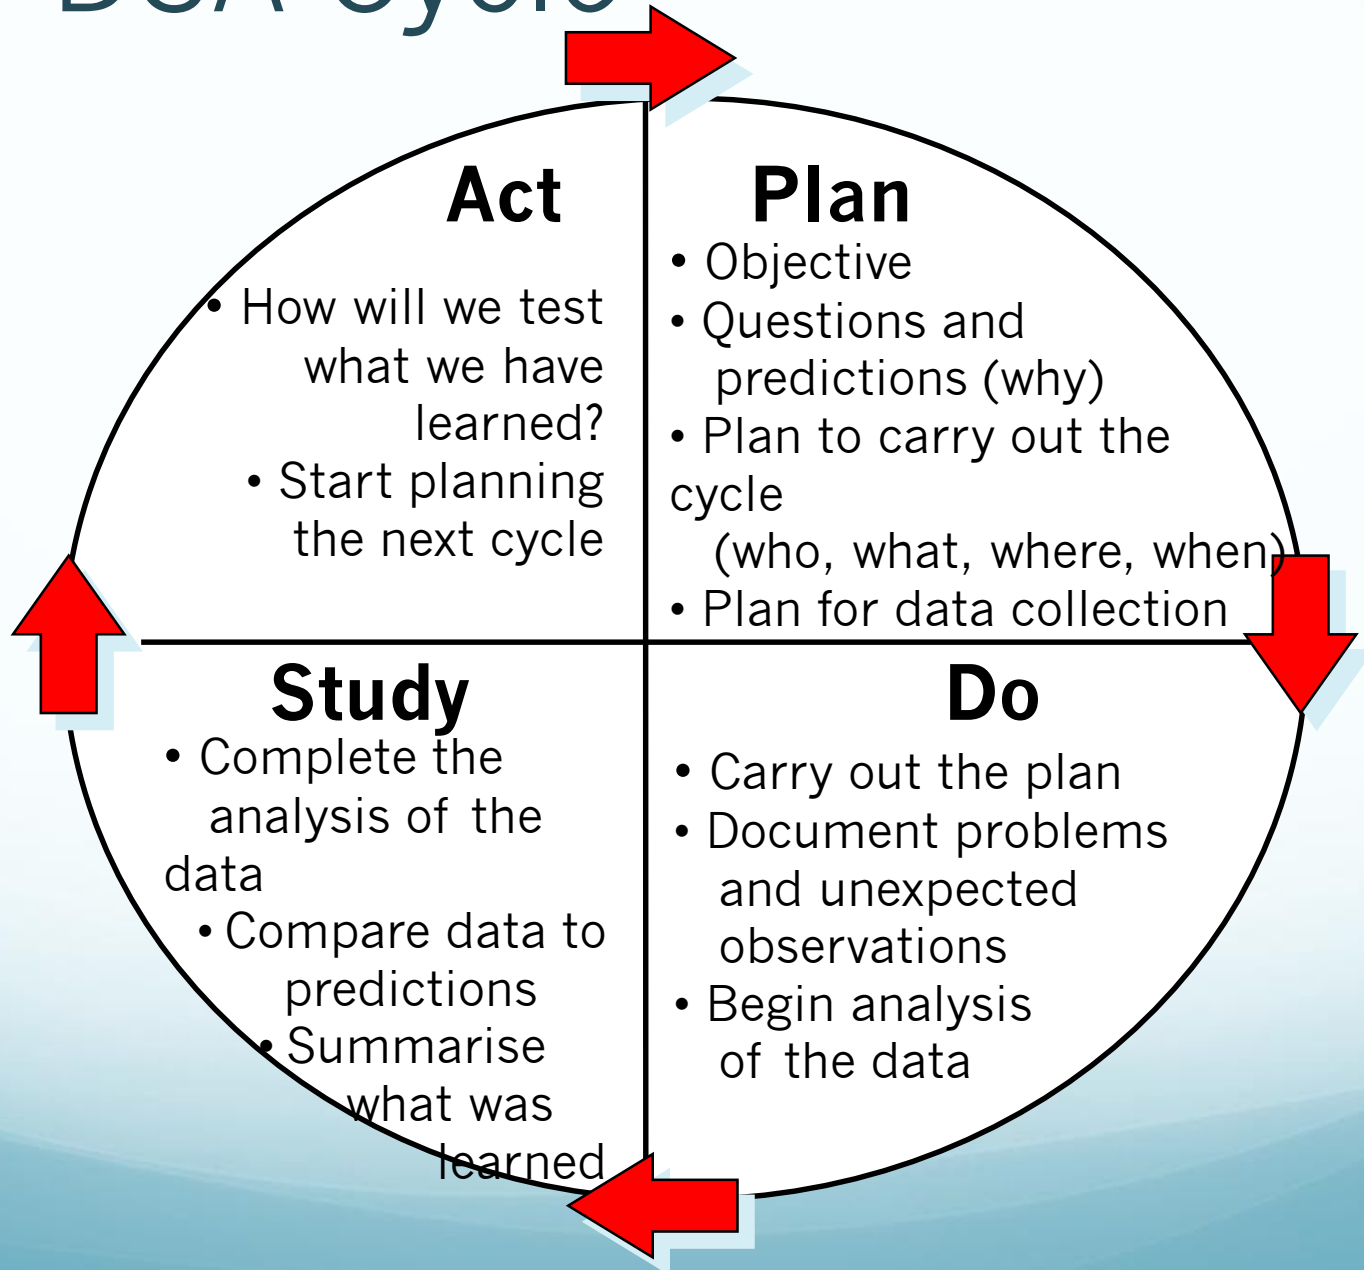

Test ideas before implementing.
PDSA Cycles are mini-audits

The Improvement Guide: A practical approach to enhancing organizational performance (2nd Edition 2009)

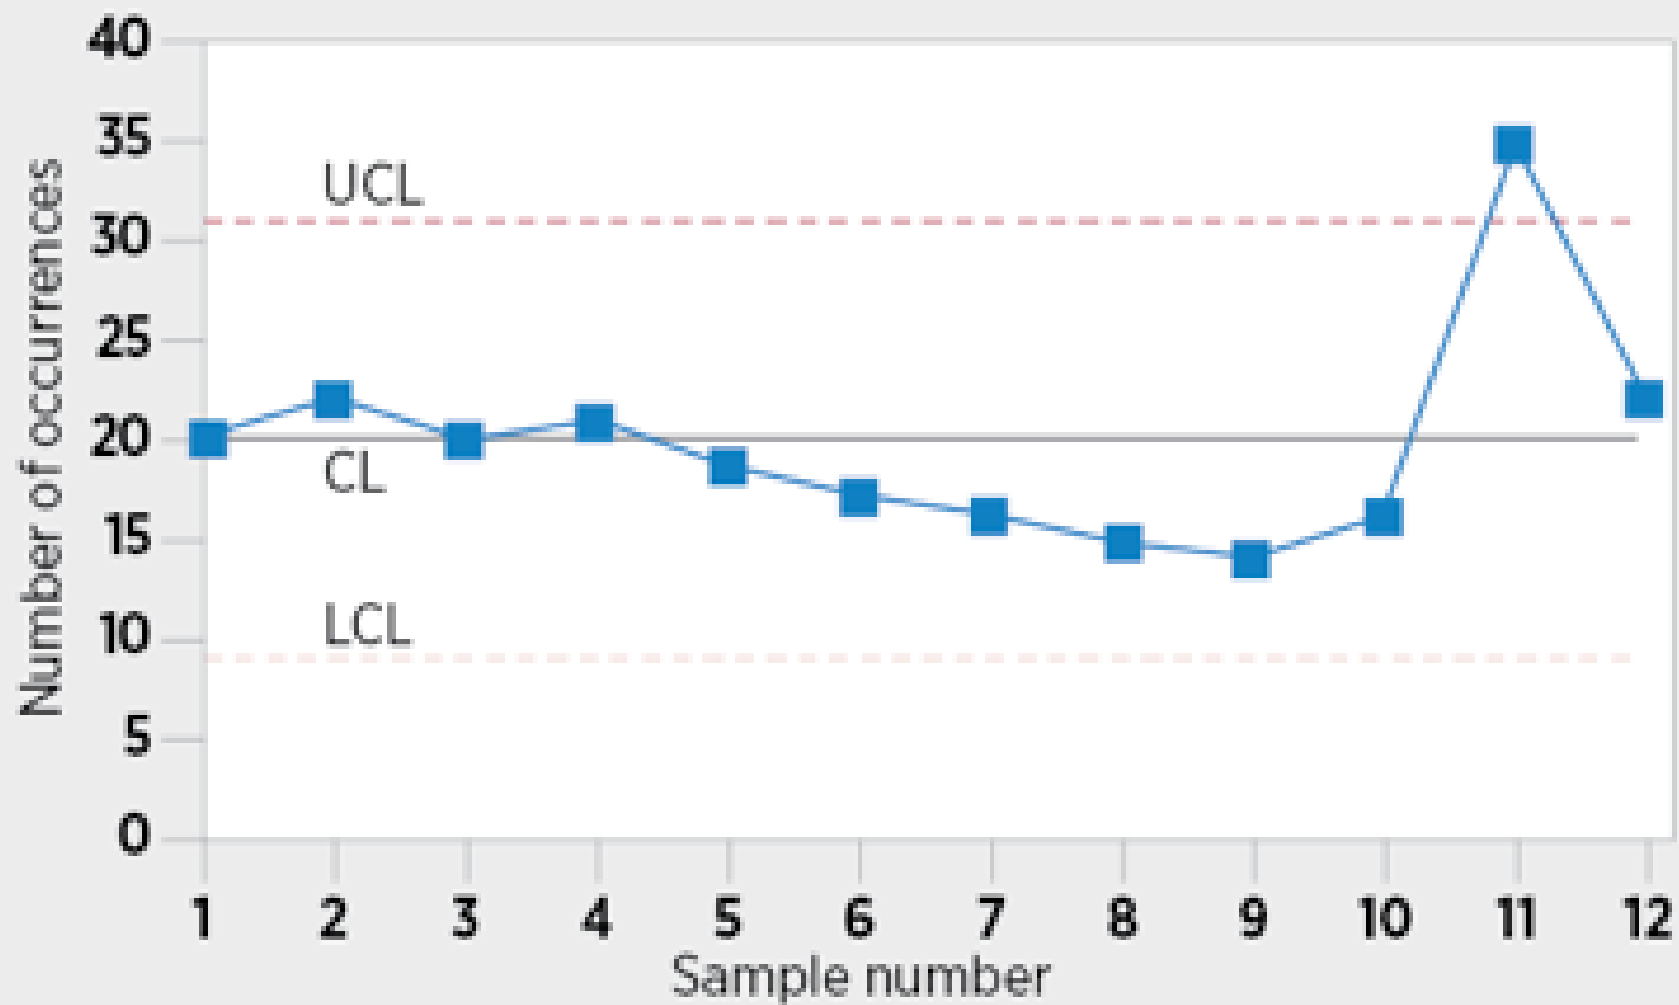

Gerard J. Langley, Kevin M. Nolan, Thomas W. Nolan,
Clifford L. Norman, Lloyd P. Provost

The PDSA Cycle

Statistical Process Control (SPC) charts

- Excellent way of **measuring for improvement**
- Use the pattern of events in the past to predict with some degree of certainty where future events should fall
- Distinguish between the natural/common cause variation and special cause variation
- Enable you to look for problems when they are there, not when they are not
- Can motivate staff to improve practice thereby reducing adverse events and minimising variation

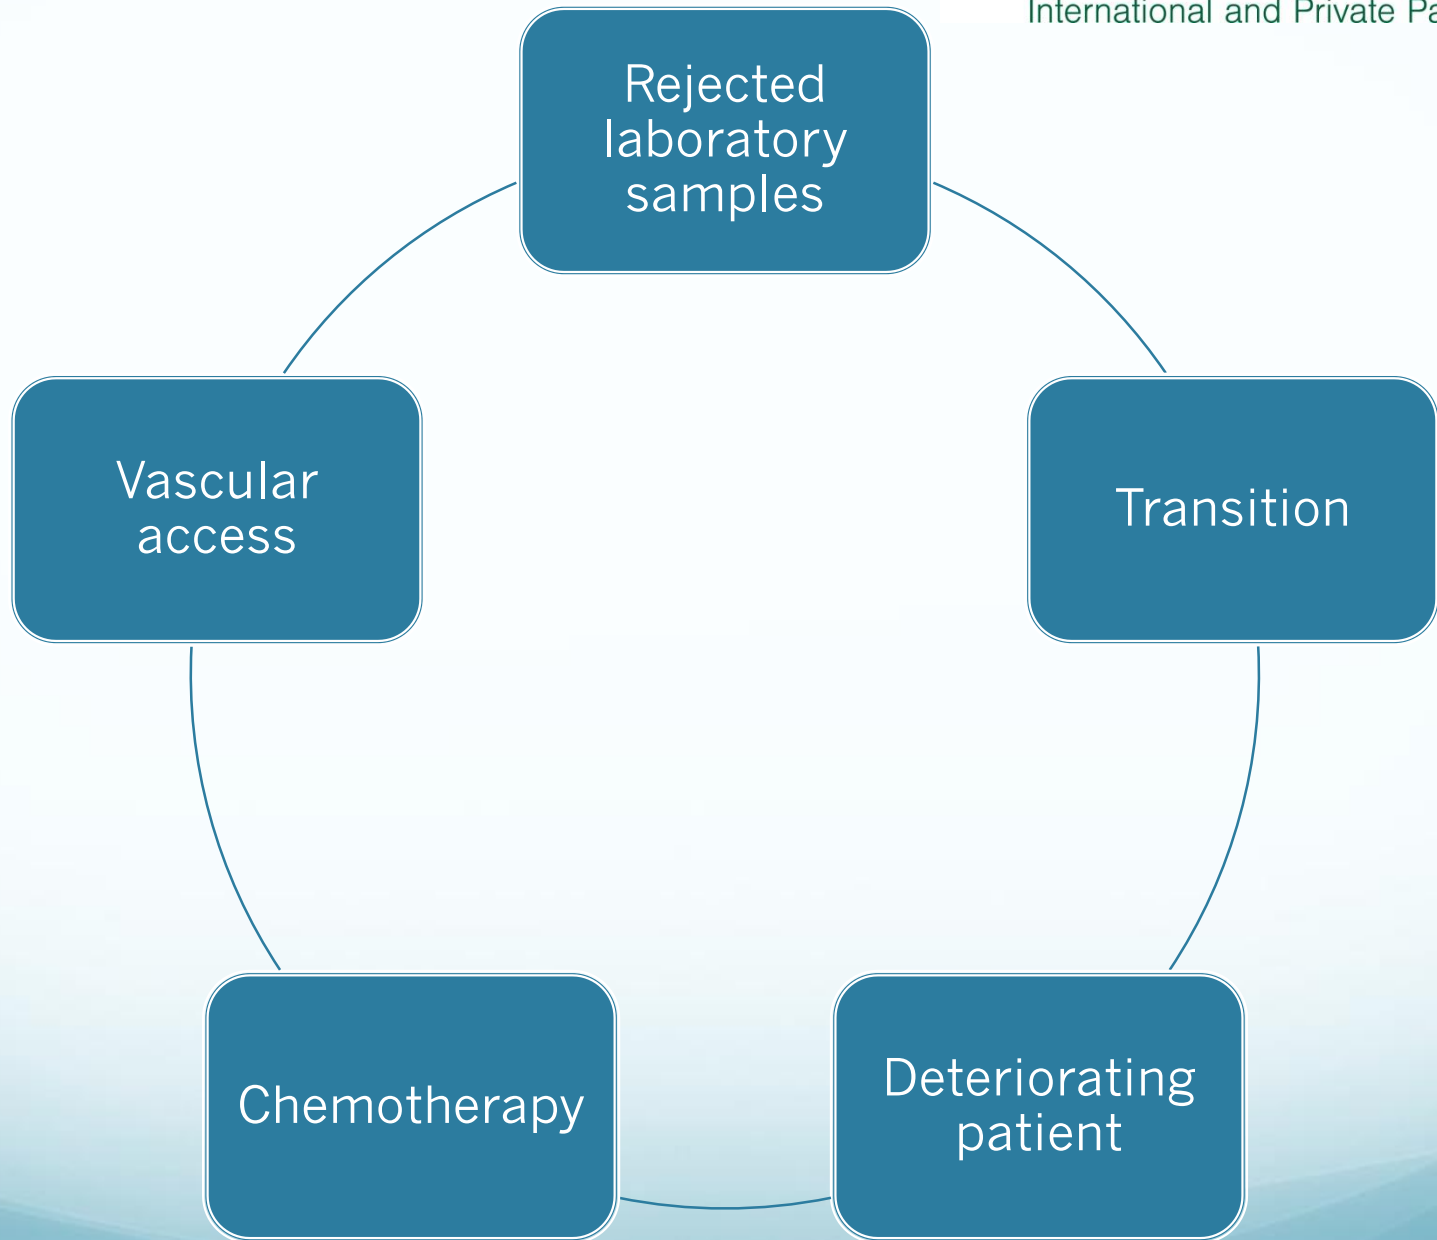

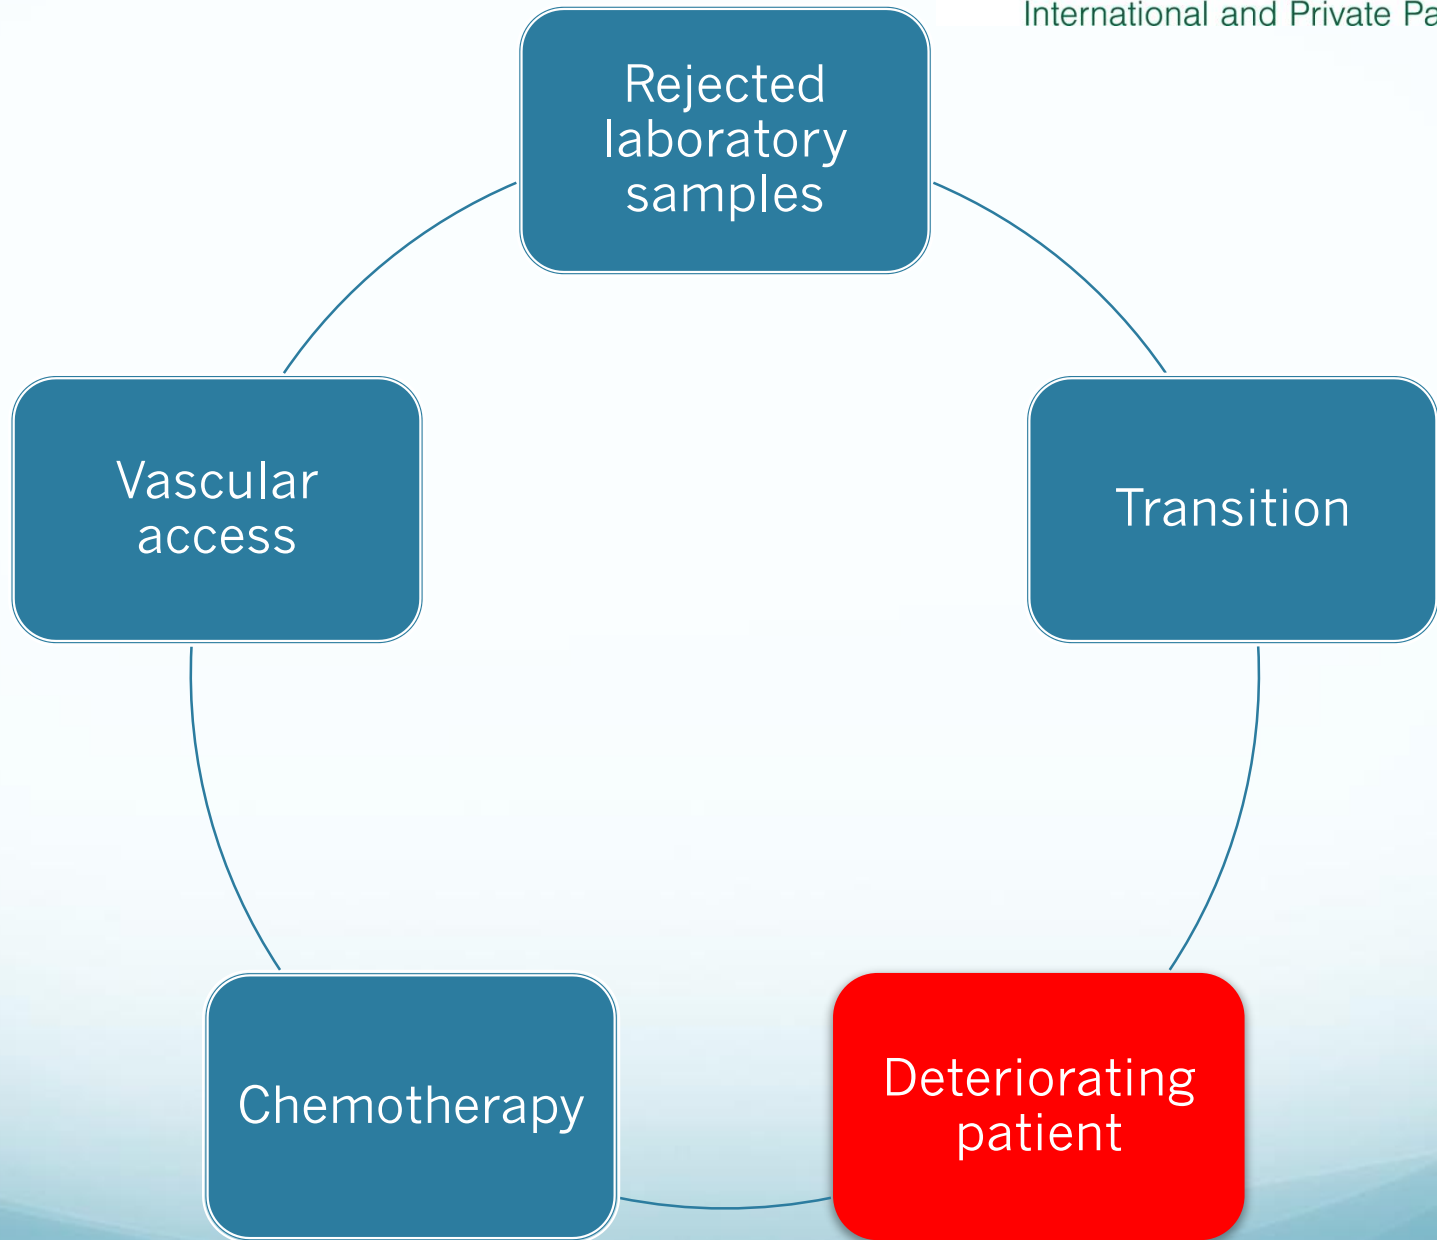

SPC charts

Natural cause versus special cause variation

- All special causes should be investigated to see whether they are an indication of process change and / or improvement.
- **Runs** - seven consecutive points above or below the mean/median
- **Trends** - seven consecutive points all increasing or decreasing
- **Outliers** - a data point which is outside of the control limits

Key issues around deteriorating hospitalised patients

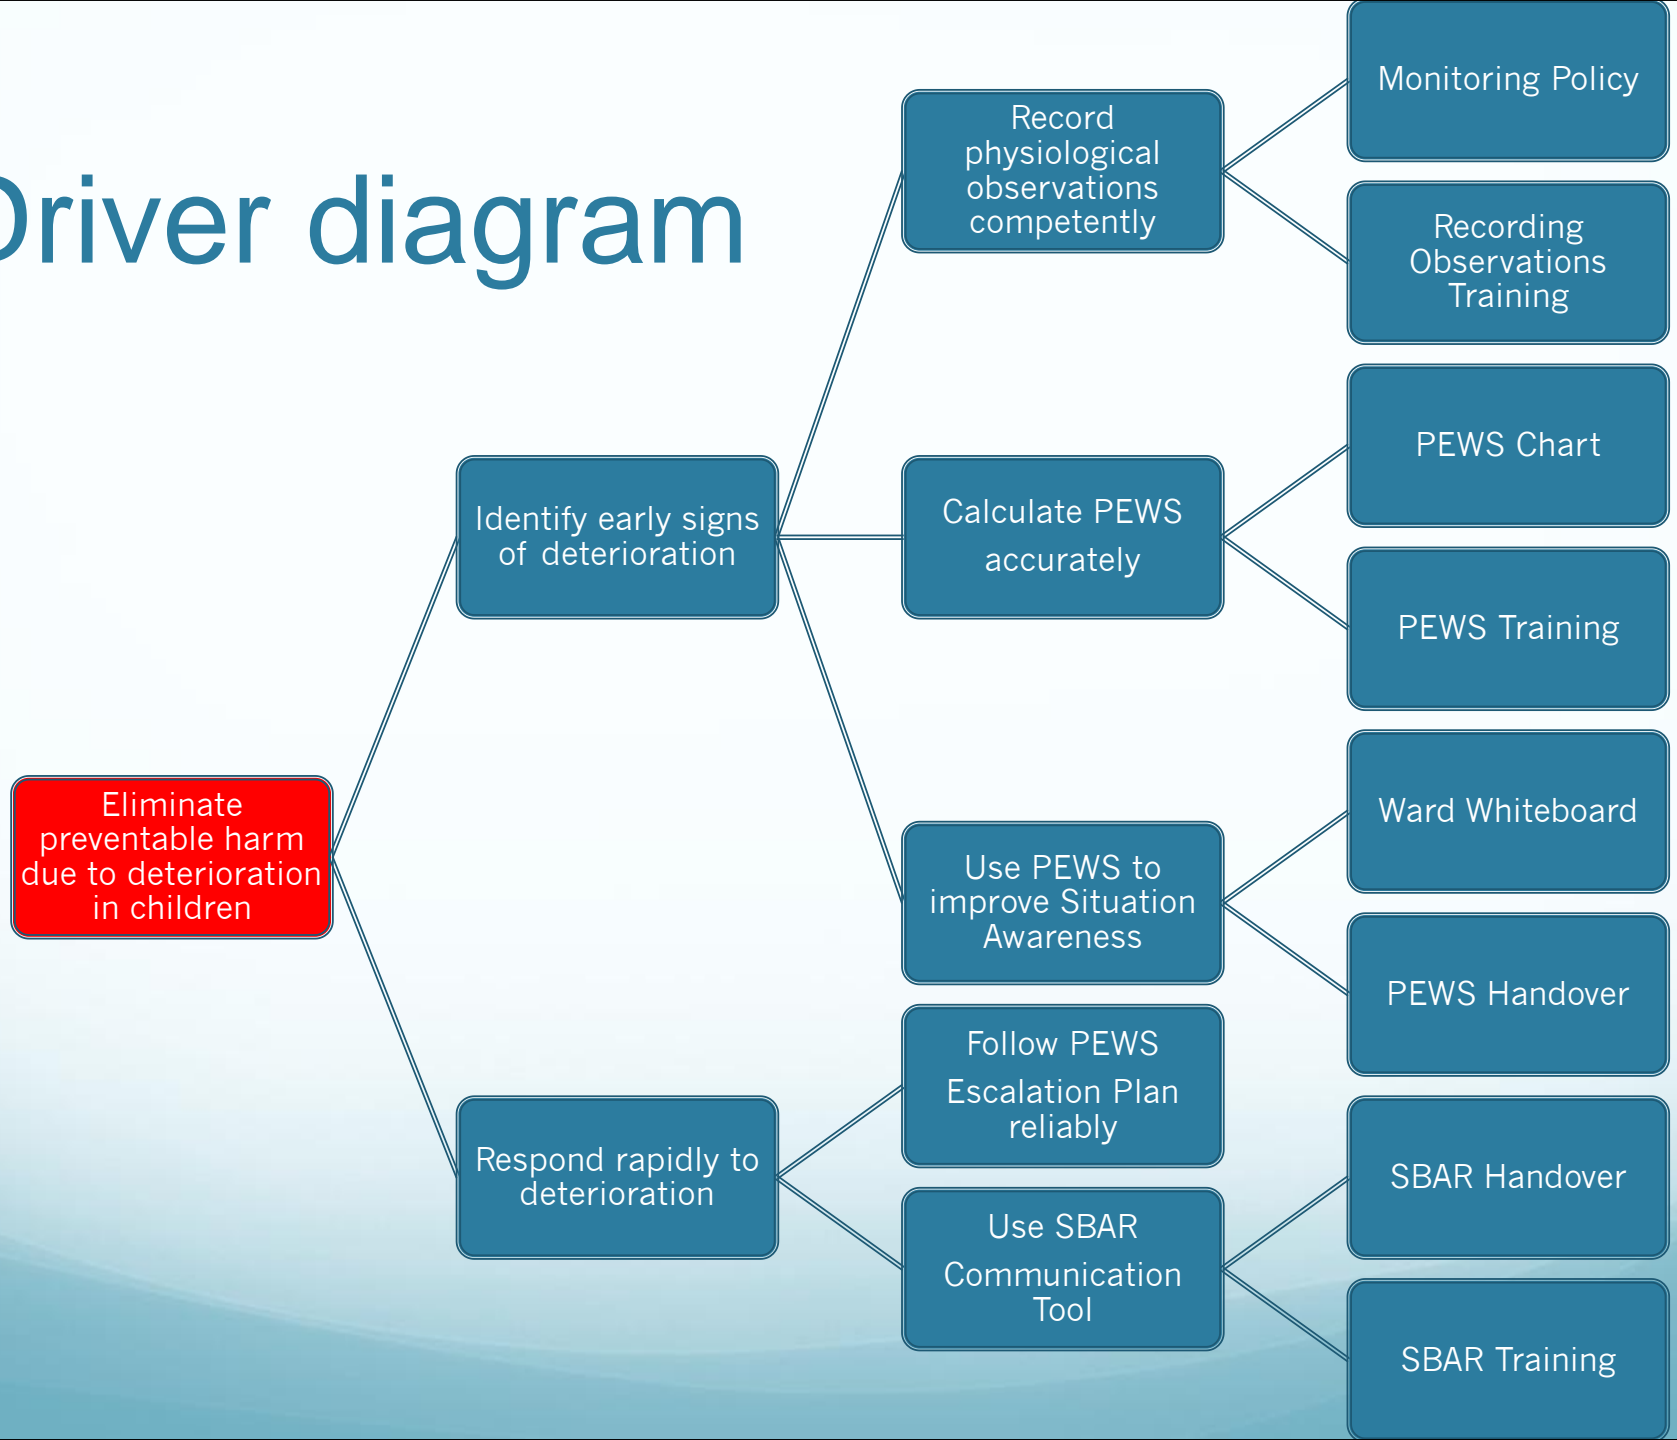

- Failure to monitor
- Failure to recognise
- Failure to communicate
- Failure to respond

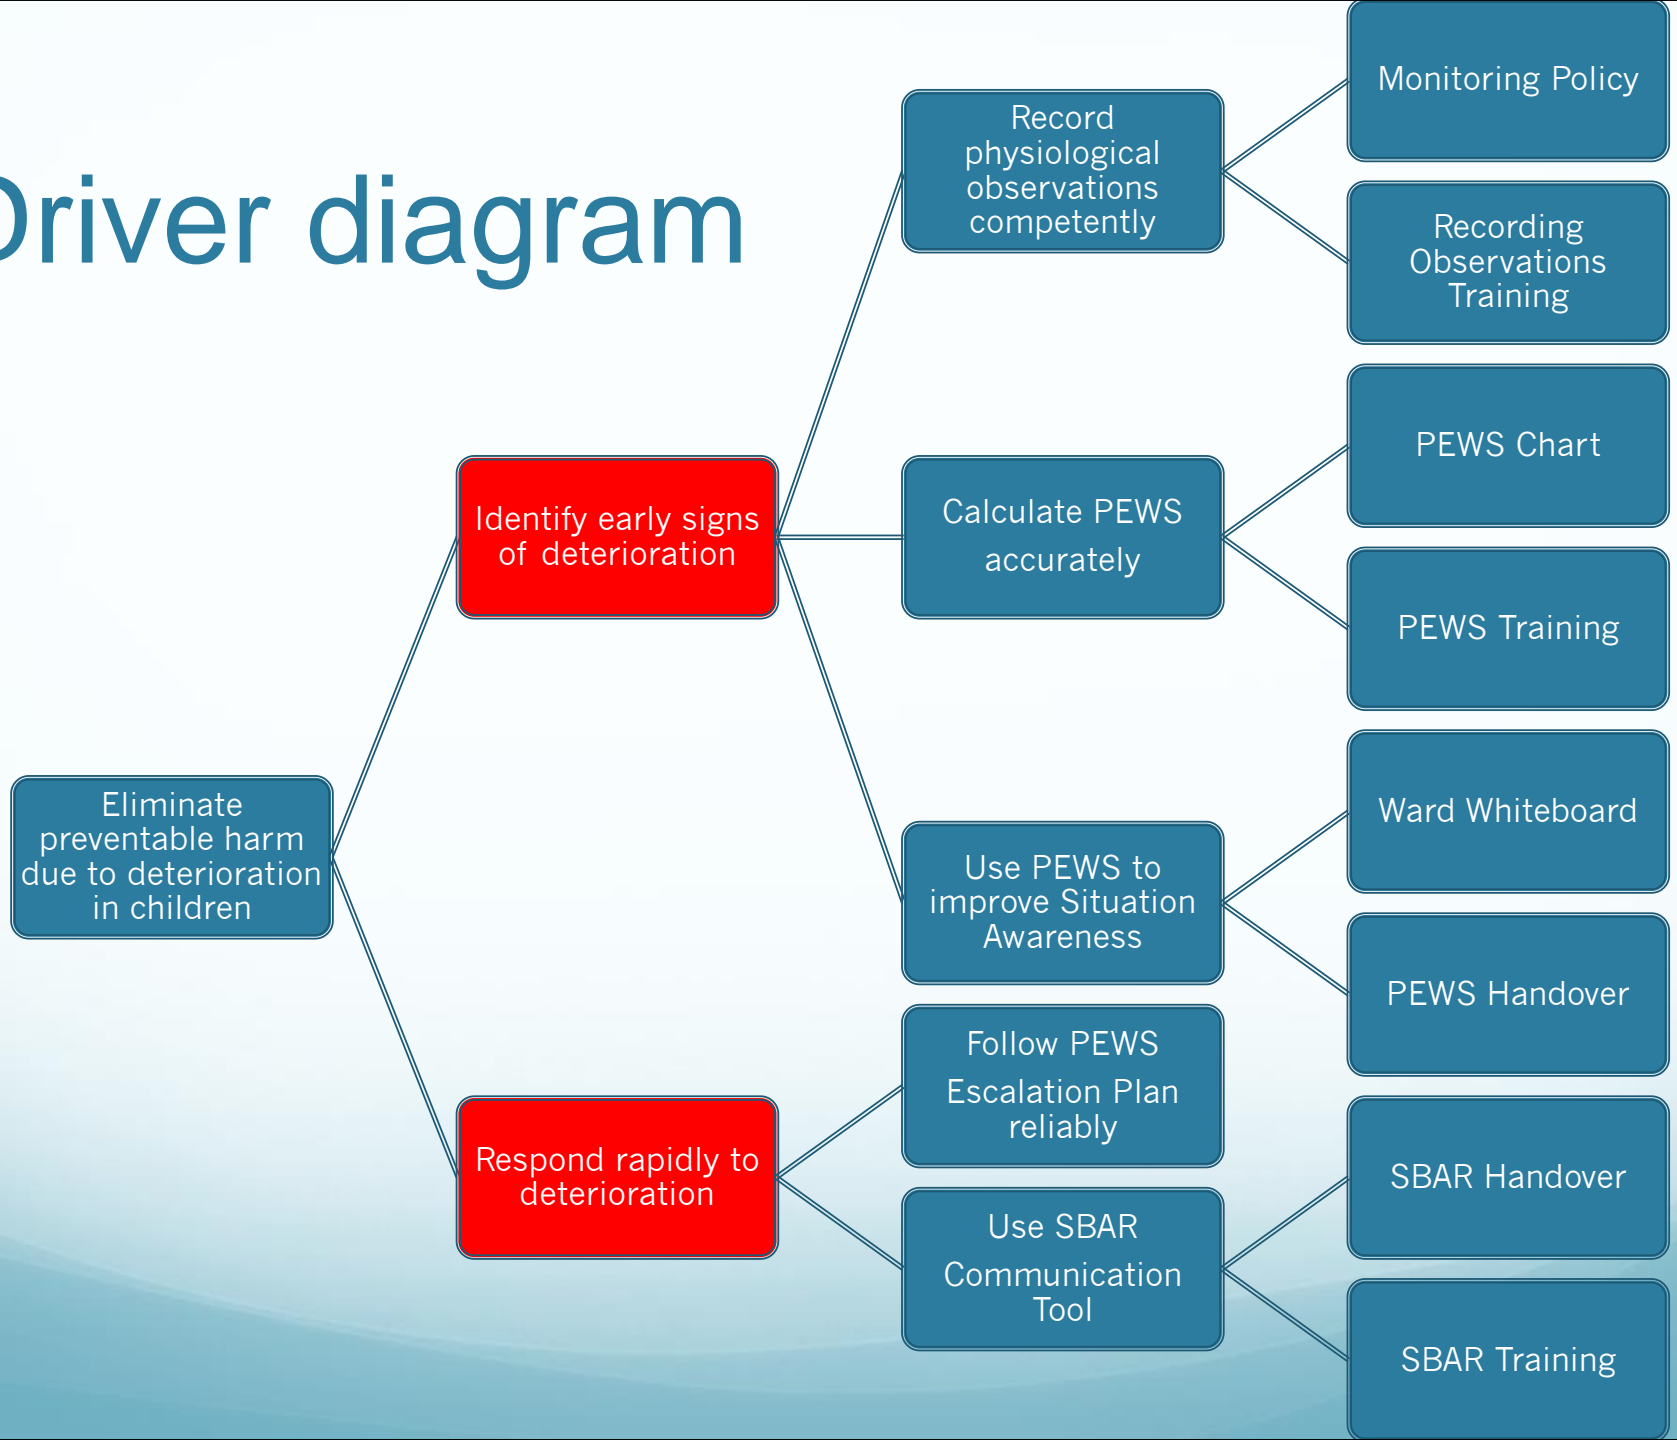

Build The Team

- Lead Nurse / Matron
- Lead Paediatrician
- Improvement Advisor
- Clinical Champions – frontline staff
- Administrator
- Executive Sponsor
- NHS Institute for innovation and improvement

Model For Improvement

← Aim – ↑ Days between crash calls to 180 within 1 year and 365 within 2 years

← Measurement: Process, Outcome and Balancing

← Frontline staff suggest innovative ideas to overcome problems

← Test ideas before implementing. PDSA Cycles are mini-audits

The Improvement Guide: A practical approach to enhancing organizational performance (2nd Edition 2009)

Gerard J. Langley, Kevin M. Nolan, Thomas W. Nolan,
Clifford L. Norman, Lloyd P. Provost

PDSA Cycle Template

PDSA Cycle Template for Testing Changes

PDSA Cycle Number:		Start Date:	End Date:
What is the purpose of this test/ cycle?	1. Collect data to develop a change <input type="checkbox"/> 2. Test a change <input type="checkbox"/>		
Short Description of Cycle Objective:			
PLAN 	Question 1:		
	Prediction:		
	Question 2:		
	Prediction:		
	Question 3:		
	Prediction:		
	Question 4:		
	Prediction:		
What change(s) will be tested?			
How will the change be tested?	Who, What, Where, When, How? Consider both the preparation and the actual test itself Test in the optimal conditions with your champions at first. Then see if it works under normal & finally, challenging conditions		
Data Collection Plan	Who, What, Where, When, How? Ensure data is "need to have", not "nice to have" Ideally the frontline clinicians will collect, analyse and own the data (measures or observations)		

DO: 	Carry out the test, collect the data and begin the analysis Describe what actually happened when you ran the test.	
STUDY: 	Complete analysis of the data. Insert graphic analysis whenever possible Describe the measured results and how they compared to the predictions Question 1: Prediction: Results: Learning:	
	Question 2: Prediction: Results: Learning:	
	Question 3: Prediction: Results: Learning:	
	Question 4: Prediction: Results: Learning:	
	Summarise what was learned overall:	
	ACT 	Plan for the next PDSA cycle. Are we ready to make a change?
	Recognise Contributors:	

Start small.....

- 1 patient
- 1 nurse

PEWS Cycles 1-9

Result: Increased buy-in from stakeholders

Cycle 9: PEWS design simplified
Tests increase from 1-3-5-all

Cycle 6-8: Design of PEWS form improved.
Tests similar to Cycle 1

Cycle 5: PEWS form now incorporated into observation form

Cycle 2-4: Design of PEWS form improved. Tests similar to Cycle 1

Cycle 1: First draft of modified Brighton PEWS – 1 nurse, 1 child, 1 shift

Safety Huddle

- 5 minute daily meeting at the ePSAG board at a specified time.
- Attended by all nurses, lead doctors and any other appropriate staff members
- PEWS & escalation plans
- Identify the sickest patient on the ward
- Identify any 'Watchers'

Safety Huddle Script

Nurse in charge

Good morning/afternoon/evening, I am... (*nurses name*)... and I will be leading this Safety Huddle. We have 5 minutes to discuss all of our patients. We will run through all of our patients in bed order. For each patient the bedside nurse will present their CEWS score. If the CEWS is higher than 2 or the patient is a "watcher" the nurse will explain why. We will discuss them as a group so that everyone is aware of the management plan and any escalation that needs to happen

Run through each patient on the ward and ask...

1. What is their CEWS?
2. If CEWS >2 or patient is a "Watcher":
 - a) Why is the patient a high CEWS / "Watcher"?
 - b) What is the management plan?
 - c) Who should their care be escalated to?*[Once the team have run through every patient...]*
3. Have parents or child raised any clinical concerns?

Nurse in charge

- Does anybody wish to identify any other concerns which have not been raised, or offer a different perspective on anything we've discussed?
- At this time, who do we agree is the sickest patient on the ward?

[If any actions have been identified during the huddle please make sure these are all allocated to individuals and are documented if necessary]

Thanks for attending. The Huddle is now finished.

What is a "Watcher"?

The idea of the watcher system is to identify patients who do not have a high CEWS score but who the team feel may still be at risk of getting sicker. People will often talk about a gut feeling, or feeling worried about a patient without being able to put their finger on why. Watchers should always be discussed at the huddle.

ChartView

Great Ormond Street Hospital for Children

International and Private Patients Service

Measure: 647 - The Number of Cardiac Arrests outside ICU / theatres

Detail: The monthly number of cardiac arrests outside of ICU wards / theatres (recorded from calls made to the 2222 Clinical Emergency Team). Cardiac arrests are defined by any patient requiring cardiac compressions and/or defibrillation. Cardiorespiratory arrests count towards the cardiac arrests total, not the respiratory arrests total.

Great Ormond Street Hospital for Children

International and Private Patients Service

Measure: 647 - The Number of Cardiac Arrests outside ICU / theatres

Detail: The monthly number of cardiac arrests outside of ICU wards / theatres (recorded from calls made to the 2222 Clinical Emergency Team). Cardiac arrests are defined by any patient requiring cardiac compressions and/or defibrillation. Cardiorespiratory arrests count towards the cardiac arrests total, not the respiratory arrests total.

⁵Clinical Operational Research

ABSTRACT

Objective To compare the predictive performance of 18 paediatric early warning systems (PEWS) in predicting critical deterioration.

Design Retrospective case-controlled study. PEWS values were calculated from existing clinical data, and the area under the receiver operator characteristic curve (AUROC) compared.

Setting UK tertiary referral children's hospital.

Patients Patients without a 'do not attempt resuscitation' order admitted between 1 January 2011 and 31 December 2012. All patients on paediatric wards who suffered a critical deterioration event were designated 'cases' and matched with a control closest in age who was present on the same ward at the same time.

What is already known on this topic?

- Paediatric early warning systems (PEWS) are widely used to detect deterioration in hospitalised children.
- The component parameters, weighting frameworks and scoring thresholds vary between differing PEWS.
- Of the numerous PEWS in the literature and clinical practice, only a minority have been previously evaluated for their predictive performance.

Table 3 Comparative performance

	AUROC (95% CI)	z-Score	p Value
Scoring systems			
Cardiff and Vale PEWS	0.89 (0.86 to 0.91)	N/A	N/A
Bedside PEWS	0.88 (0.85 to 0.91)	0.72	0.47
Modified PEWS III	0.87 (0.85 to 0.90)	1.58	0.11
Children's Early Warning Tool	0.85 (0.82 to 0.88)	3.21	0.001
Modified PEWS II	0.85 (0.82 to 0.88)	2.87	0.004
PEWS I	0.83 (0.80 to 0.86)	4.06	<0.001
NHSI PEWS	0.82 (0.79 to 0.86)	4.52	<0.001
PEWS system score	0.82 (0.78 to 0.85)	4.42	<0.001
PEWS II	0.79 (0.75 to 0.82)	6.00	<0.001
CEWS	0.79 (0.75 to 0.82)	7.12	<0.001
ITAT score	0.77 (0.74 to 0.81)	7.12	<0.001
Modified PEWS I	0.74 (0.70 to 0.78)	8.06	<0.001
Trigger systems			
THSC MET calling criteria	0.73 (0.69 to 0.77)	9.31	<0.001
MET activation criteria I	0.71 (0.70 to 0.75)	10.70	<0.001
MET activation criteria II	0.71 (0.70 to 0.75)	10.70	<0.001
PMET triggers I	0.71 (0.67–0.75)	10.82	<0.001
Modified Bristol PEWS	0.62 (0.58 to 0.67)	16.01	<0.001
Bristol PEWS	0.62 (0.58 to 0.67)	16.01	<0.001

Performance was assessed by calculation of the AUROC. Systems were then ranked, and performance was compared with the highest ranked PEWS (Cardiff and Vale PEWS) using Delong's test for correlated curves. z-scores represent comparison of mean values. Significance testing was adjusted for the multiple comparisons of AUROC with Bonferroni's correction, meaning values of $p < 0.0025$ were considered significant.

AUROC, area under the receiver operator characteristic curve; CEWS, Children's Early Warning Score; ITAT, inpatient triage, assessment and treatment score; MET, Medical Emergency Team; NHSI, NHS Institute; PEWS, paediatric early warning system; PMET, Paediatric Medical Emergency Team; THSC, Toronto Hospital for Sick Children.

Conclusion

- Quality improvement is everyone's responsibility
- Start small
- Start simple
- Measure
- Use a variety of tools
- Nurses are in great position to lead QI
